

Overlap by subject among institutions

This table shows the overlap in holdings of books published 2000-2007, comparing each institution to each other institution. Reading across each row, the numbers indicate the percentage of the holdings of the library in column A that are held in the collections of each of the other libraries. For example, 34.43% of Eden-Webster's agriculture collection is held by MU, but only 1.03% of MU's agriculture collection is held by Eden-Webster. Shaded cells indicate an overlap of at least 25%. Many shaded cells in a column indicates a comprehensive collection with strong holdings, including large portions of other libraries' holdings. Many shaded cells in a row indicates a collection, large portions of which are held by many others, probably a more concentrated collection of core titles. Boldface indicates that each collection holds at least 25% of the other collection's holdings.

Although there is some overlap between academic and public libraries, the highest concentration occurs among libraries of the same type. Separating the two types of libraries shows that there is much higher overlap among public library collections than among the academic MOBIUS libraries. There are several possible explanations for this: a) there is less diversity in needs served by public libraries; b) the absence of a shared catalog makes checking for duplication inconvenient; c) funding for public library collections is more closely calibrated to the book market for this population.
